

05 - Vibe Coding Playbook & Prompts

Six controlled AI-coding passes for Antigravity, Cursor and GitHub Copilot

GROW MY THERAPY - STAGE 2 SELECTION ASSIGNMENT

How to use this guide

Use AI as an implementation partner, not as the designer of record. Feed one bounded task at a time, require it to inspect the existing code before editing, forbid unrelated changes, and run tests after every pass. Commit after each stable milestone so you can roll back quickly.

KEY DECISION Do not paste all six prompts at once. Finish, test and commit each pass before moving to the next. This directly supports the company's instruction to use AI intelligently rather than blind copy-paste.

Prompt 1 - Repository foundation

You are working on a Grow My Therapy frontend internship selection assignment. Build a production-quality Next.js App Router + TypeScript + Tailwind project. Before changing anything, inspect the repository. Do not add unnecessary packages. Create a clean folder structure for layout, homepage sections, UI primitives and typed content. Use Server Components by default. Only interactive components may be client components. Add strict lint/type-check scripts, accessible base styles, reusable color/spacing tokens, and a professional README skeleton. Do not build any backend, auth, database or API unless I explicitly ask. After editing, run lint and type-check and report only real errors.

Prompt 2 - Accurate reference clone

I am now building Part 1 of the assignment. Preserve the exact section order, hierarchy, grid logic, whitespace rhythm, image proportions and responsive behavior of the Conejo Valley Family Counseling homepage reference. Do not redesign yet. Use the screenshots/reference I provide as the source of truth. Measure before guessing. Build reusable sections and keep all static sections as Server Components. Do not invent extra content. At desktop, tablet and mobile widths, verify there is no overflow, no accidental spacing drift and no layout collapse. Make the smallest changes needed for visual accuracy.

Prompt 3 - Theme and content migration

Part 1 is stable. Now create Part 2 without changing the established layout structure. Replace the theme with these tokens: primary #24352F, secondary #E9DED0, accent #B8795B, surface #FAF8F4, text #242723. Replace all homepage copy using only the supplied Dr. Maya Reynolds profile facts. Primary focus: adults in Santa Monica dealing with anxiety, panic, trauma, burnout, perfectionism and chronic stress. Modalities: CBT, EMDR, mindfulness-based practices and body-oriented techniques. Therapy style: warm, collaborative, grounded. Offer in-person Santa Monica therapy and secure telehealth for California clients. Never invent fees, insurance, testimonials, phone/email, availability, guarantees or credentials not in the profile. Keep the redesigned content natural, concise and SEO-aware.

Prompt 4 - Images and custom Our Office section

Replace every old reference-site image with a new image that supports the new theme. Use Dr. Maya's supplied portrait in the bio. Use the supplied office images for a completely new Our Office section, which did not exist in the original template. Place the new section where it feels natural in the homepage story, preferably after About and before FAQs/final CTA. The office section must mention the supplied Santa Monica address, in-person sessions, secure telehealth in California, privacy, natural light, calm and

uncluttered environment - but only using facts from the profile. Optimize images with next/image, meaningful alt text and correct responsive sizes. Avoid random stock-photo choices and avoid heavy filters on the actual office photos.

Prompt 5 - Performance, accessibility and re-render audit

Audit this homepage as a senior frontend engineer. Do not redesign it. Find unnecessary client components, hydration, useEffect calls, global state, unstable props, repeated assets, layout shift, oversized images, inaccessible controls, keyboard traps, weak focus states, incorrect heading order, low contrast and mobile overflow. Convert static components back to Server Components where possible. Keep FAQ/mobile menu state local. Do not add React.memo unless there is a measured reason. Respect prefers-reduced-motion. After fixes, run lint, type-check and the available tests. Summarize exactly what changed and why.

Prompt 6 - Final evaluator QA and submission pass

Act as a strict evaluator for the Grow My Therapy Stage 2 assignment. Check the repository against these scoring categories: UI cloning accuracy 25%, theme/design 25%, copy/images 10%, custom Our Office section 10%, Loom communication 30%. Verify the site is responsive, all Maya copy is profile-supported, all images are replaced, office images are used, local Santa Monica SEO is present, the fictional demo is noindex, and there are no secrets or broken links. Do not make broad rewrites. Produce a prioritized punch list: Blocker, High, Medium, Nice-to-have. Then fix only Blocker and High issues, run tests, and leave a short submission checklist for Vercel, public GitHub and Loom.

Tool-specific operating habits

Tool	Best use
Antigravity	Use for planned multi-file implementation passes. Keep prompts bounded and ask it to inspect files before editing.
Cursor	Use for repository-aware refactors, component extraction, code review and fixing targeted issues across related files.
GitHub Copilot	Use for small local completions, tests, utility functions and repetitive JSX/Tailwind after the architecture is already decided.

Guardrails to paste at the end of any prompt

- Do not change working unrelated code.
- Do not install a dependency without explaining why it is necessary.
- Do not fabricate profile facts or client claims.
- Do not silently replace the required layout with a generic SaaS template.
- Do not use “use client” at page/layout level unless unavoidable.
- Do not create a backend just because it is possible.
- Run formatting/lint/type checks after edits.
- List the files changed and the reason for each change.
