

06 - QA, Deployment, Loom & Submission

The final selection checklist that protects a strong build from avoidable mistakes

GROW MY THERAPY - STAGE 2 SELECTION ASSIGNMENT

1. Final QA matrix

Area	Pass criteria
Clone fidelity	Section order, max-widths, whitespace rhythm, typography hierarchy, image ratios and responsive stacking visibly match the reference before redesign.
Theme	Clearly different palette and imagery, but still harmonious and therapy-appropriate.
Copy	Every clinical/service statement can be traced to the Maya profile. No invented details.
Office	Custom section exists, uses supplied office images, exact supplied Santa Monica address, and profile-supported environment/session details.
Responsive	No overflow or awkward cropping at 320/375/768/1024/1440+ widths.
Accessibility	Keyboard navigation, focus, labels, heading structure, alt text, contrast and reduced-motion pass.
Performance	Optimized images, minimal JS, no unnecessary client providers, no console errors.
Repository	Public, clean history, README, no secrets, no dead code, meaningful commits.
Production	Deployed URL works in incognito and on a real phone.
Video	About 5 minutes, client-facing language, desktop + mobile, design choices + profile usage explained.

2. Manual browser test script

1. Open production site in a fresh/incognito browser.
2. Resize from large desktop to 1024, 768, 430, 390, 375 and 320px.

3. Tab through all interactive elements. Focus indicator must always be visible.
4. Open/close mobile navigation using keyboard and touch.
5. Open every FAQ. Confirm only intended content moves and no page-wide rerender/jump occurs.
6. Check every CTA target. There should be no # placeholders unless intentionally scrolling to an existing section.
7. Disable JavaScript mentally or with tools: core content should remain server-rendered and readable.
8. Inspect network: no 404 image requests, no multi-megabyte images, no unnecessary third-party scripts.
9. Check console: zero React hydration warnings, key warnings or runtime errors.
10. Test the production site on at least one physical mobile device.

3. Lighthouse targets

Do not chase a perfect score at the cost of design fidelity. Aim for a consistently strong result with no obvious red flags. Accessibility and Best Practices should be especially clean. Performance should not be damaged by oversized images, unnecessary animation libraries, or large client bundles.

4. GitHub README outline

Dr. Maya Reynolds Therapy Website

Assignment Summary

- Part 1: reference homepage clone
- Part 2: redesigned theme/copy/images from supplied profile
- Part 3: custom Our Office section

Tech

Next.js, TypeScript, Tailwind CSS

Local Setup

install -> dev -> lint -> typecheck -> test

Design Decisions

Palette, typography, imagery, responsive strategy

Content Source

Dr. Maya Reynolds profile supplied with the assignment

Third-Party Tools / Asset Sources

List packages, deployment, fonts and licensed image sources

Accessibility & Performance

Short summary of implementation choices

5. Vercel deployment checklist

- Push final tested branch to the public GitHub repository.
- Import repo into Vercel and deploy from the intended production branch.
- If there are no secrets, the project should deploy without environment variables.
- Confirm the canonical production URL renders all local images and fonts.
- Use noindex metadata because the therapist/profile is fictional.
- Run one final mobile test against the production URL, not localhost.

6. Five-minute Loom structure

Time	What to say/show
0:00-0:30	Introduce it as “your new website draft” for Dr. Maya. State the goal: calm, grounded therapy site for adults in Santa Monica and across California via telehealth.
0:30-1:20	Show hero + opening sections. Explain the emotional hierarchy, local-service message and why the imagery/color palette feels calm and trustworthy.
1:20-2:20	Show the three services. Explain that they were selected directly from Maya’s work: anxiety/panic, trauma/EMDR, burnout/perfectionism.
2:20-3:00	Show About. Explain warm/collaborative/grounded approach and the evidence-based modalities in simple client language.
3:00-3:40	Show the new Our Office section and supplied office photos. Mention Santa Monica, natural light, privacy, in-person + secure California telehealth.
3:40-4:15	Show FAQs and how they answer common fit questions using only Maya’s profile.
4:15-4:50	Switch to mobile. Show navigation, responsive layout, images and FAQ interaction.
4:50-5:00	Close with benefit-focused summary and thank the client/evaluator.

7. Sample non-technical phrases for the video

- “I kept the layout spacious so the page feels calm and easy to take in.”
- “I chose these three services because they match the concerns you described most clearly in your profile.”
- “The warmer green and terracotta palette is meant to feel grounded and human rather than overly clinical.”
- “I used your actual office photos here so a potential client can get a realistic sense of the space before arriving.”
- “On mobile, the same information becomes a simple one-column flow so it remains easy to scan and use.”

8. Submission package

11. Live site URL (Vercel/Netlify/similar).
12. Public GitHub repository URL.
13. Five-minute Loom video URL.
14. Submit all three through the company’s provided submission form before the six-day Internshala deadline.

9. Last 30-minute check before submitting

- No spelling mistakes in “Santa Monica,” “Dr. Maya Reynolds, PsyD,” “CBT,” or “EMDR.”
- No old Conejo Valley names, locations, logos, images or copy remain in the redesign.
- No lorem ipsum, TODO comments or broken anchor links.
- No secrets in repository or build logs.
- All office/profile images load on production.
- Public repo opens without access request.
- Loom link opens without access request.
- Production link works in incognito.
- Submission is sent before the deadline, not at the final minute.
